3DISC to introduce new dental radiography system

by Dental Tribune International

CHICAGO, USA: Specialist in imaging products 3DISC has announced that it is launching the next generation of its FireCR Dental Reader in December. The reader is the latest addition to the company's line of compact, affordable computed radiography systems and software products for the dental market.

The new FireCR Dental Reader, which is about the size of a shoebox and can thus be integrated into the dental practice very easily, has a number of new features and capabilities that facilitate workflow and optimize chairside time with patients. According to [3DISC](#), the reader allows for faster diagnosis and streamlined patient care.

The device is equipped with the company's new QuantorTab software, which can be downloaded for use on tablet computers running Android and iOS operating systems, and provides dentists with immediate access to patients' dental images, allowing chairside interactive review with patients about possible treatment options.

3DISC will also introduce its new FireID RFID Reader, which can be connected via USB cable to the FireCR Dental workstation, providing quick and accurate registration of data relevant to each patient, the company stated.

The system will be launched at the Scientific Assembly and Annual Meeting of the Radiological Society of North America, which will be held Dec. 1–6 in Chicago. It will be available worldwide in the first quarter of 2014.
