Note: This exposure chart was made using a parallel, 10:1 ratio grid, focused at ~1m (3 feet).
Exposure factors may vary between OEMs and the equipment's current maintenance level can also affect the outcome.
The Exposure Index (EI) is an approximate indicator of the dose that reaches the image receptor. The range is 1800-2200.
Dose>2200=Over Exposed. On all Bucky work, use as high an mA station possible to help minimize patient motion.
